

Project Requirements Document: Google Fiber Repeat Caller Analysis

BI Analyst: [Your Name]

Client/Sponsor: Emma Santiago, Hiring Manager; Keith Portone, Project Manager

Purpose

Google Fiber's customer service leadership needs to understand how often customers call back after their first inquiry, in order to evaluate first-contact resolution effectiveness. This project delivers a dashboard revealing repeat-caller trends — by market, problem type, and time period — so the team can identify root causes of repeat calls and take action to reduce call volume through better customer satisfaction and operational optimization.

Key Dependencies

Team: Ian Ortega (BI Analyst), Sylvie Essa (BI Analyst)

Primary contacts: Emma Santiago and Keith Portone

Data dependency: Fictionalized, pre-anonymized, pre-approved customer support call dataset (calls, repeat calls, call type, market city, date)

Expected deliverable: A dashboard measuring repeat calls by first-contact date, by market and problem type, and by week/month/quarter/year trend views

Stakeholder Requirements

Requirement	Priority
Chart/table: repeat calls by first-contact date	R — Required
Chart/table: repeat calls by market and problem type	R — Required
Charts: repeat calls by week, month, and quarter	R — Required
Trend view by year (in addition to week/month/quarter)	R — Required
Accessible design (large print, text-to-speech)	R — Required
Stakeholder access to underlying datasets	R — Required

Success Criteria

The project is successful if the dashboard clearly shows how often repeat calls occur, which problem types drive the most repeat calls, and which market city has the highest repeat-call rate — presented in a way that ties directly to the team's goal of reducing overall call volume through improved customer satisfaction and operational efficiency.

User Journeys

Current state: Leaders lack a consolidated view of repeat-call patterns, making it difficult to know whether the team is resolving issues on first contact or to identify which issue types or markets need attention.

Future state: Stakeholders open the dashboard and can immediately see repeat-call volume trends by date, market, and problem type, filterable by week, month, quarter, or year — using it to prioritize process or training improvements.

Assumptions

- The dataset is already anonymized and approved for use, so no additional privacy review is required before development.
- A 'repeat call' is defined as any contact from the same customer within 7 days of their initial contact (contacts_n through contacts_n_6).
- Market and problem-type codes (market_1-3, Type_1-5) will be relabeled with descriptive names in the dashboard for stakeholder clarity.

Compliance and Privacy

The dataset is a fictionalized version of real data, already anonymized and approved — no personal customer information is included, so no further anonymization is required.

Accessibility

The dashboard must support large print and text-to-speech alternatives, per the requirement from Minna Rah (Lead BI Analyst).

Timeline

No specific delivery timeline was provided in the project notes; to be confirmed with Keith Portone (Project Manager).

Access is limited to the 5 named individuals: Emma Santiago, Keith Portone, Minna Rah, Ian Ortega, and Sylvie Essa.
