

Stakeholder Requirements Document: Google Fiber Repeat Caller Analysis

BI Analyst: [Your Name]

Date: [Date]

Stakeholders

Name	Title / Team	Role in Project
Emma Santiago	Hiring Manager	Primary contact; sponsor
Keith Portone	Project Manager	Primary contact; sets project requirements & deliverables
Minna Rah	Lead BI Analyst	Sets accessibility requirement; technical oversight

Team members: Ian Ortega (BI Analyst), Sylvie Essa (BI Analyst)

Project Goal

Explore trends in repeat callers to Google Fiber's customer service team, so leaders can understand how effectively the team resolves customer questions on the first contact, and identify ways to reduce repeat-call volume by improving customer satisfaction and operational efficiency.

Primary Business Questions

- How often does the customer service team receive repeat calls from customers?
- What problem types generate the most repeat calls?
- Which market city's customer service team receives the most repeat calls?

Stakeholder-Specific Requirements

- Keith Portone (Project Manager): Understand how often customers call again after their first inquiry; identify which issue types generate more repeat calls; compare repeat-caller trends across the three market cities; view trends by week, month, quarter, and year.
- Minna Rah (Lead BI Analyst): Dashboard must be accessible, with large print and text-to-speech alternatives; stakeholders must have access to the underlying datasets so they can review the analytical steps taken.
- Emma Santiago (Hiring Manager): Dashboard should clearly demonstrate an understanding of the team's ultimate goal — reducing call volume through improved customer satisfaction and operational optimization.

Data Requirements

- Dataset: fictionalized, anonymized version of Google Fiber customer support call data (pre-approved for use).
- Fields: number of calls, number of repeat calls after first contact, call/problem type, market city, date.
- Markets are coded market_1, market_2, and market_3, representing three city service areas.
- Problem types are coded Type_1 (account management), Type_2 (technician troubleshooting), Type_3 (scheduling), Type_4 (construction), and Type_5 (internet and wifi).
- Repeat calls are tracked over 7-day windows: the initial contact is contacts_n; subsequent columns (e.g., contacts_n_6) indicate days since first contact.

Success Criteria

- Dashboard clearly shows repeat-call volume by first-contact date.
- Dashboard breaks down repeat calls by market city and problem type.
- Dashboard supports trend views by week, month, quarter, and year.
- Dashboard demonstrates a clear link between the insights shown and the team's goal of reducing call volume via better first-contact resolution.

Access

Dashboard-viewing privileges: Emma Santiago, Keith Portone, Minna Rah, Ian Ortega, and Sylvie Essa. Stakeholders also need access to the underlying datasets to review the analytical process.

Out of Scope

Any personally identifiable customer information — the dataset is pre-anonymized and fictionalized, so no further anonymization work is required.
